Large deviations for heavy-tailed random walks

Theorem (Pakes-Veraberbeke)

Suppose X_i 's and the integrated tail, $v(\cdot)$, are subexponential then

$$u(b) \sim v(b) := \frac{1}{\mu} \int_{b}^{\infty} P(X_{i} > t) dt$$

as b ∕ ∞.

Contributions and Setup

Regularly Varying Case

Semiexponential Case

Conclusions

Simulation for heavy-tailed random walks

Theorem (B.-Glynn 07)

Suppose $X_i \in S^*$ let W satisfy

$$P\left(W>t
ight)=\min\{rac{1}{\mu}\int_{b}^{\infty}P\left(X_{i}>t
ight)dt$$
, 1}

and define $P^{Q}\left(\cdot
ight)$,

$$P^Q\left(S_{n+1}\in dy|S_n=s
ight)=rac{f\left(y-s
ight)v\left(b-y
ight)}{w\left(b-s
ight)}dy,$$

where w(b-s) = E[v(b-s-X)]. Then,

 E_0^Q [2nd moment IS estimator] $\leq cu(b)^2$

and $E^{Q}\tau_{b}=O\left(b\right)$ if $E\left|X\right|^{2+\varepsilon}<\infty$.

Simulation for heavy-tailed random walks

- Replacing v(b) by u(b) in $P^Q(...)$ gives zero variance
- Drawbacks? Computing w (b)
- What if EX^2 ? Termination time?

Contributions and Setup

Regularly Varying Case

Semiexponential Case

Conclusions

Large deviations for heavy-tailed random walks

Theorem (Asmussen-Kluppelberg)

(Simplified) If $P(X_i > t) \sim ct^{-\alpha}$ for $\alpha > 1$. Then, conditional on $\tau_b < \infty$, we have that

$$\left(\frac{S_{u\tau_b}}{\tau_b},\frac{S_{\tau_b}-b}{b},\frac{\tau_b}{b}\right) \Longrightarrow (-\mu u, Z_1, Z_2)$$

on $D(0,1) \times R \times R$ as $b \nearrow \infty$, where Z_1 and Z_2 are Pareto with index $\alpha - 1$.

• So,
$$E(\tau_b | \tau_b < \infty) = \infty$$
 if $\alpha \in (1, 2)$ &
 $E(\tau_b | \tau_b < \infty) = O(b)$ if $\alpha > 2$.

Contributions and Setup

Regularly Varying Case

Semiexponential Case 0000000000

Conclusions

Large deviations for heavy-tailed random walks

Theorem (Asmussen-Kluppelberg)

(Simplified) If $P(X_i > t) \sim ct^{-\alpha}$ for $\alpha > 1$. Then, conditional on $\tau_b < \infty$, we have that

$$\left(\frac{S_{u\tau_b}}{\tau_b},\frac{S_{\tau_b}-b}{b},\frac{\tau_b}{b}\right) \Longrightarrow (-\mu u, Z_1, Z_2)$$

on $D(0,1) \times R \times R$ as $b \nearrow \infty$, where Z_1 and Z_2 are Pareto with index $\alpha - 1$.

- So, $E(\tau_b | \tau_b < \infty) = \infty$ if $\alpha \in (1, 2)$ & $E(\tau_b | \tau_b < \infty) = O(b)$ if $\alpha > 2$.
- Are we doomed?

Semiexponential Case

Conclusions

Step 1: Parametric family (discussion)

- Role of $a \in (0, 1)$: Capture rogue sample paths, $(X|X > x) \approx x + xZ$, where $Z \ge 0$ is Pareto
- How to choose p(s)? Use large deviations results

Step 1: Parametric family (discussion)

- Role of $a \in (0, 1)$: Capture rogue sample paths, $(X|X > x) \approx x + xZ$, where $Z \ge 0$ is Pareto
- How to choose p(s)? Use large deviations results
- Given no jump by time t, $S_t \approx -\mu t$ & jumping to b at t+1 given $\tau_b < \infty$

$$p(s) \approx \frac{P(X - \mu t > b)}{\int_0^\infty P(X - \mu t > b) dt} = \frac{\mu P(X > b + \mu t)}{\int_b^\infty P(X > u) du} = O\left(\frac{1}{b}\right).$$

Introduction Contributions and Setup Regularly Varying Case Semiexponential

Conclusions

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Step 2: Lyapunov inequalities (variance control)

Lemma (B. & Glynn '07)

Suppose that there is a positive function $g\left(\cdot
ight)$ such that

$$E\left(rac{g\left(s+X
ight)}{g\left(s
ight)} imesrac{f\left(X
ight)}{f\left(X|s
ight)}
ight)\leq1$$

and $g(s) \ge 1$ for s > b. Then,

 $E_{s}^{Q}(2nd moment IS) \leq g(s)$.

Step 2: Guessing Lyapunov function

• Want bounded relative error, so pick (for $\kappa > 0$)

$$g(s) = \min\left(\kappa\left(\int_{b-s}^{\infty} P(X > u) du\right)^2, 1\right).$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

Step 2: Guessing Lyapunov function

• Want bounded relative error, so pick (for $\kappa > 0$)

$$g(s) = \min\left(\kappa\left(\int_{b-s}^{\infty} P(X > u) du\right)^2, 1\right)$$

• Earlier discussion suggests (θ to be selected)

$$p(s) = \theta \frac{P(X > b - s)}{\int_{b-s}^{\infty} P(X > s) du}$$

Introduction	

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

• On g(s) < 1 suffices to check

$$\begin{split} & E\left(\frac{g\left(s+X\right)}{g\left(s\right)}\times\frac{f\left(X\right)}{f\left(X|s\right)}\right) \\ & \leq \quad \frac{P\left(X>a\left(b-s\right)\right)^{2}}{p\left(s\right)g\left(s\right)}+\frac{E\left(g\left(s+X\right);X\leq a\left(b-s\right)\right)}{\left(1-p\left(s\right)\right)g\left(s\right)}\leq 1 \end{split}$$

Summary of results on bounded relative error and termination time

Theorem (B. & Liu)

if X_i 's A1-A3 apply then can select mixture parameters using Lyapunov inequalities to guarantee: A) Total variation approximation (asymptotically zero relative error), B) Bounded relative error and $O(b^{1-\beta})$ termination time. If in addition X_i is in MDA of Gumble law then

$$\left(\frac{S_{u\tau_{b}}+\mu\tau_{b}}{\sqrt{\tau_{b}}},\Lambda'(b)\times(S_{\tau_{b}}-b),\Lambda'(b)\times\tau_{b}\right)$$
$$\implies (\sigma B(u),Z_{1},Z_{2})$$

on $D(0,1) \times R \times R$ as $b \nearrow \infty$, where Z_1 and Z_2 are independent exponentials.
